Personal AI at Work

What to Do. What Not to Do. And Why It Matters.

NetGain Technologies | CyberCrimeJunkies.com | AI Governance Workshop

DO <i>Keep your job. Keep your data.</i>	DON'T <i>Get fired. Get sued. Get breached.</i>
✓ Ask yourself one question first. <i>"Would I be fine if this exact text showed up company-wide, with my name on it?" Yes: proceed. No: stop and anonymize.</i>	✗ Don't paste anything you would not own in public. <i>Source code, customer data, financials, credentials, legal documents, meeting recordings. Not anonymized. Not in a temporary chat. Not in any form. These categories are never safe on a personal account.</i>
✓ Turn off model training. Now. <i>Claude: Settings > Privacy > toggle off "Help improve our AI models." ChatGPT: Settings > Data Controls > same toggle. Grok and Gemini too. They can hold your conversations for up to 5 years if you leave it on.</i>	✗ Don't leave model training on. <i>The default setting on every personal AI plan is: train on your conversations. Samsung engineers found this out the hard way. Three separate code leaks in twenty days. The data could not be recalled.</i>
✓ Use Incognito or Temporary Chat for work. <i>Claude calls it Incognito. ChatGPT calls it Temporary Chat. It never saves. It never trains. Close it and it is gone. Make it your default for everything work-related.</i>	✗ Don't connect work accounts to personal AI. <i>Connect your work Gmail and the AI can read your entire mailbox. All of it. In 2025, researchers proved a connected AI can be hijacked by content it reads to steal your own data. They called it the lethal trifecta.</i>
✓ Anonymize before you paste. <i>Swap real names for roles. "The client" not the client's name. "Company A" not the actual company. Fake numbers of similar scale. The AI needs the shape of the problem. Not the real data.</i>	✗ Don't upload the original file. <i>PDFs and spreadsheets carry hidden metadata: author names, tracked changes, comments, hidden columns. Copy out only what you need. Leave the source file alone.</i>
✓ Paste only what is needed. <i>Copy out the one paragraph or field you need. Do not upload the original file. It carries author names, comments, tracked changes, and columns you forgot were there.</i>	✗ Don't trust a third-party connector you did not choose from the official directory. <i>A remote connector can quietly change what it does after you approve it. Use only connectors listed inside your AI platform's own connector directory.</i>
✓ Connect the least, with the narrowest access. <i>If you must connect a personal AI to a service, pick read-only. Pick one folder over all of Drive. If you can paste the one thing you need instead, skip the connector entirely.</i>	✗ Don't paste logins, passwords, API keys, or access tokens. <i>Ever. Under any framing. No exceptions.</i>
✓ Review and disconnect connectors monthly. <i>Open your AI settings and your Google or Microsoft third-party access page. Cut anything you are not actively using.</i>	✗ Don't build a side project on your company's AI. <i>Your employment agreement may give the company ownership of anything created using company tools. Check before you build.</i>
✓ Push your company to pay for the right AI. <i>Individual workarounds protect one person. A governed, company-paid tool with real training protects everyone. That is the only clean answer for regulated data.</i>	✗ Don't assume deleted chats stay deleted. <i>A Delaware court in 2026 ordered production of a CEO's "deleted" ChatGPT conversations as evidence. He had used them to strategize avoiding a \$250 million payment. The chats surfaced anyway. They became the case.</i>

How To Get AI To Teach You Anything, Step By Step

Moving Target

YOUR AI STEP-BY-STEP COACH PROMPT

Instructions

Copy and paste this exactly into any AI tool (ChatGPT, Claude, Copilot, Gemini). Then tell it what you want to learn.

You are my personal AI coach. I am not technical. I may not know what a file path is, where a button lives, or what "run the prompt" means in practice. Assume this is my first real project with AI.

Here is how you will work with me:

First, map the full path. Show me every step we need to take from start to finish, numbered, before we begin anything. Do not skip this.

Then, coach me through exactly one step at a time. Do not give me step two until I tell you step one is done and I understand it. If I seem confused, simplify further. Do not move on.

I do the work. You show me the exact move. I make it. You wait.

If I ever ask you a question about something we just did, answer it and then bring me back to where we were before moving forward.

Your goal is for me to finish this on my own and be able to repeat it next week without you.

When you are ready to start, ask me one question: What do you want to accomplish today?

Next Step

Once the AI asks you that question, describe what you want in plain language. You do not need to know the technical term. Just tell it what you want the end result to look like.

Most Common Governance Gaps

Gaps

No Current AI Inventory

Data Lineage

Data Integrity

Data Security

Access Control

Human Oversight

Compliance Tracking

Audit Logging-Eyes on Glass

Increased Risks

Shadow AI. Compliance, Breach & Legal Risks skyrocket.

Undocumented Unapproved Training Data

Garbage in. Overconfident Garbage out.

Sensitive Data exposed without logging, encryption or filter blocking.

No Role-based permissions. High risk.

Autopilot without H-I-L.

Vendor compliance does not equal Your Compliance.

Blind usage without ability to determine IP loss or cause.

Your AI Governance Checklist

Governance Unlocks Creativity & ROI

Moving Target

This checklist will not make you invincible. Nothing will. Governance unlocks creativity. It will move you out of the way and become an extremely hard target to hit. That is the goal. Not Fort Knox. Not perfect. Just not the easiest target.

Work through this with your leadership team. Not with IT alone. With the people who make governance decisions, hiring decisions, vendor decisions, and policy decisions. Because that is where the gap lives.

	Foundation	What You Have
☐	AI Governance Team	<i>Inclusive. C-Suite, Department Heads and Field Staff champions. Feedback loop up and down. Full final authority must be given to this team.</i>
☐	AI Acceptable Use Policy	<i>A written, signed policy that defines which AI tools are approved, what categories of data may be entered into them, and who approves exceptions. Not a one-page memo. Document with teeth.</i>
☐	Approved Tool List	<i>A current list of AI tools that have been reviewed and cleared. Not tools people are using. Tools that have been evaluated. Everything else is shadow AI until it appears on this list.</i>
☐	Data Classification Framework	<i>A clear definition of what data is sensitive, what data is internal, and what data must never enter an AI tool; especially a shared-model platform that trains on client contributions.</i>
☐	Vendor Review Process	<i>Before any AI tool goes on the approved list, someone reads the terms of service and asks the tough questions on data storage, training etc.</i>
	Visibility & Control	Must See & Control Data
☐	SOAR/SIEM	<i>A security orchestration automation response through managed SIEM flags anomalies in real time. If nobody is watching the logs, the logs are decorative and data is gone. Catches threat actors at moment they break in, not weeks/months later when it rises to level of full "breach".</i>
☐	MEDR	<i>Managed endpoint detection and response. Stop threats like ransomware at the computer/server level. SOAR catches them, MEDR acts on it and stops them</i>
☐	ITDR	<i>Identity threat detection and response. This watches credential behavior — who accessed what, when, from where, and whether that pattern matches</i>
☐	Canary Deception	<i>Enticing deceptive assets planted in network. When threats attack them, they are caught.</i>
☐	DNS Filtering	<i>Domain Name System filters, intercepts and restricts web traffic at the foundational "phonebook" level of the internet. In terms of blocking AI leaks, it acts as a primary barrier to prevent employees from sending company data to unauthorized, high-risk Generative AI websites and services</i>

Your AI Governance Checklist

Governance Unlocks Creativity & ROI (Cont.)

Moving Target

	PEOPLE	High-Risk Layer
☐	BYOD Policy Enforced	Personal devices that access company email, company IP or company systems are governed by a written policy with enforcement. A personal phone carrying your credentials and your network access profile is a company security decision, not an employee convenience decision.
☐	Hiring Verification Updated	Your hiring process includes live in person or video verification through a channel you initiate, reference calls placed to numbers you find independently, and real-time technical assessments for any role with system access. A ten-out-of-ten resume is now a yellow flag, not a green one
☐	Executive Profile Reviewed	The public digital footprint of your senior leaders — LinkedIn videos, conference recordings, podcast appearances, keynote recordings — has been assessed. Every recording is raw material for voice cloning and deepfake construction. Know what is out there.
☐	Incident Response Contact List Current	The list of people to call when the screens go dark is current, tested, and in at least three places. The insurer and law enforcement's incident line number — not main office — is known by every person who would need it at 3am.
	PRACTICE	VALIDATE & TEST
☐	Tabletop Exercise Run	Simulated a real-world ransomware and AI breach scenario with the full incident response team — not just leadership, but floor supervisors, IT, HR, communications. The debrief produced a list of things to fix. Those things were fixed. Schedule the next one. (2x per year)
☐	IR Plan Tested	Documented does not mean tested. Run the tabletop and call the resources, isolate the systems, verify remediation before testing again.
☐	AI Output Audited	AI system's outputs are being reviewed against known-good baselines. Subtly skewed vendor recommendations and competitive intelligence anomalies are investigated, not attributed to training data issues and filed.

BONUS CONTENT

New True Crime Book Series.

*True Nonfiction Story of Real-world AI Risks
and How One Leader Overcame.*

Book 1 — The Art of Online Camouflage

Stevie Parker isn't reckless. She's busy. The twelve mistakes she makes are the same ones everyone makes. The criminals already knew that. True crime meets cybersecurity in the book that shows ordinary people how organized crime already has their information and what to do before that becomes a problem.

-Available everywhere (print, ePub & audiobook).

Book 2 — The Obedient Machine

Stevie survived the first book. Then she handed the keys to an AI she didn't fully understand. A dormant breach activates. A \$770K acquisition dies. The criminals weren't done. Neither was she. The sequel that every executive deploying AI right now needs to read before they find out the hard way.

-Available everywhere (print, ePub & audiobook).

Book 3 — Ghost and the Machine

The criminals found Stevie twice. She decided there wouldn't be a third time. Book 3 follows Stevie as she dismantles her public identity, builds a clean isolated AI, and becomes the person organized crime can't locate.

-Final book in the Moving Target Trilogy. Coming Fall 2026.
